

## Simple Band\_Name\_Gen

Create as simple name gen using python program and I learn a new method called 'ord' in python which is do accepts a string of length 1 as an argument and returns the Unicode code point representation of the passed argument. For example, ord('B') returns 66 which is a Unicode code point value of character 'B'.

And I create 2 different lists of categories (animals and adjectives) mixed with ord function and connect them both in the end so the user can gen random band name based on answers and its length
